

Eliminates the costs, time and risks of paper-based processes

Empowers staff to focus on patient care whether onsite or in the field

Extends the functionality of your EMR and other core HIT applications

Real-time information access elevates patient care in behavioral health

By managing clinical and financial content electronically, OnBase by Hyland enterprise content management (ECM) solutions for behavioral health help clinicians and staff deliver unified, connected care through real-time access to information.

Through a seamless integration with your electronic medical record (EMR) and other core healthcare information technology (HIT) applications, OnBase offers clinicians and staff immediate access to the information they need from within the familiar applications they use every day.

Extends your EMR and other core HIT applications' functionality

Most EMRs do not contain the entire patient record, typically because the solution doesn't store paper, forms, faxes, clinical images or videos. OnBase fills the gaps in your EMR and other core HIT systems, ensuring that your clinicians and staff quickly and easily access the information they need, when and where they need it. The solution captures and securely stores critical patient information in one centralized electronic repository. This not only improves how your clinicians and staff access and share information – it also improves how your systems do.

By integrating directly with your EMR and other clinical applications and government systems, OnBase connects all of these systems, creating a new level of interoperability. This increases their functionality and fills the gaps in your EMR while easing processes like medical records management (MRM) – all without having to manage multiple, expensive third-party systems. OnBase even extends to mobile devices, surpassing the limited mobile options of most EMRs.

Empowers staff to focus on care while onsite or in the field

In paper-based environments, patient information may be found in filing cabinets, on desks or even in someone's car. Not so with OnBase.

By centralizing your organization's content, OnBase provides clinicians and staff immediate access to information whether they're working at the hospital or from a tablet during a home visit. Authorized users quickly call up related content securely stored and managed in OnBase from within their everyday applications. An offline mobile client even allows caregivers to access necessary information without internet access.

OnBase empowers clinicians and staff by providing them with a more complete patient picture, elevating patient care and service while speeding processes in departments throughout your organization.

Eliminates the costs, time and risks of paper-based processes

By managing your information electronically, OnBase reduces the expense of paper-based processes. From human resources (HR) to accounts payable to contract management, OnBase allows immediate access to accurate, relevant information to help processes run smoother – and faster.

Unlike document management solutions, OnBase features native business process tools that offer organizations much more than scan-store-retrieve functionality. Advanced workflows automatically route documents to the appropriate people in the appropriate department, expediting tasks while removing the risk associated with manual, paper-based processes.

With OnBase, content doesn't get lost. Timer-based notifications keep users on task and dropdown menus create consistent, accurate and appropriate documentation.
